

Capability Statement

Off-Site Manufacturing (OSM)

- Griffdon Engineering's Off-Site Manufacturing capability enables projects to be delivered faster, safer, and more efficiently through the prefabrication of electrical components and assemblies in a controlled environment. By reducing on-site labour requirements and improving quality control, OSM provides significant programme and productivity benefits.
- Our services include the manufacture of containment modules, support systems, prefabricated electrical assemblies, pre-wired components, and bespoke modular solutions tailored to project requirements. Each assembly undergoes strict quality checks and testing before delivery, ensuring consistency and reliability.
- By integrating off-site manufacturing into project delivery, Griffdon Engineering helps clients reduce installation time, improve safety performance, minimise waste, and achieve greater certainty in programme delivery.
